GUIDE

CLONE YOUR OWN VOICE LOCALLY AND FOR FREE

Oct 21, 2026

What you will achieve:

a copy of your own voice that runs on your own computer, with no account, subscription or credit limits (the tool is OmniVoice, open source under the Apache-2.0 license). You type a text and it speaks it in your voice.

What this guide is for:

it walks you through the five steps below, from picking a recording to checking the result. Claude prepares the files and you run one installer on your computer. In our test it kept a French accent when speaking English; I have not tested other voices.

STEP-BY-STEP GUIDE

Five steps take you from a recording to a cloned voice, in the order shown below.

Five steps from a recording to a cloned voice, with one Terminal line

▲ the 5 steps, in order, with the one Terminal step highlighted

Ready to start? Copy and paste the prompt on page 6, at the end of this guide, into a new Claude conversation. It is also available as a separate file: prompt.md on GitHub.

BEFORE YOU START

Note before you start: Claude settings. The prompt asks Claude to convert your recording and write an installer file, so Claude must be able to run code and create files. Anthropic says that on Free, Pro and Max plans "Code execution and file creation" is enabled by default and can be switched in Settings > Capabilities (source).

This guide was made from a regular Claude chat, per the person who ran it. In that chat Claude worked on its own and never ran anything on the computer: it converted the audio and wrote the installer script, and the person ran the script in Terminal.

1 **Pick a recording of your voice.** Any video or audio of you speaking works, such as a video you already made; you do not need to convert it yourself. Look for a stretch with no music or other voices, in the language you want the clone to speak.

OPTIONAL

Note on step 1: extracting the audio from a video on an iPhone yourself (optional). In the Shortcuts app, build a shortcut with Select Photos (to pick the video), then Encode Media with Audio Only turned on, then Save File (source). The Encode Media action can only save M4A or AIF, not WAV (Six Colors), so Claude still converts the file to WAV in step 2.

2

Paste the prompt and attach your file. Open a new Claude conversation, paste the prompt from the next section and attach your recording to the same message. Claude asks about your computer first, then prepares your clip as a WAV file and writes one installer script.

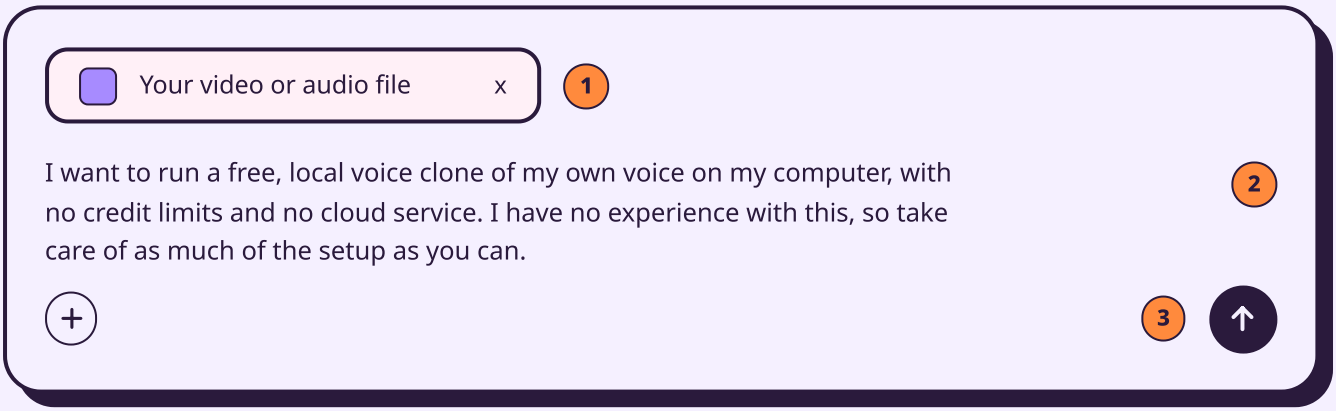

NOTE

Note on step 2. Claude asks for your operating system, chip or processor, memory (RAM) and whether you have an NVIDIA graphics card. The OmniVoice README gives different PyTorch setups for NVIDIA GPUs, Apple Silicon and Intel Arc, so the right install depends on your answers.

Claude cuts a 3 to 10 second clip (the README advises that length because longer audio slows inference and may hurt cloning quality) and converts it to a mono, 16-bit WAV. In our test, Voicebox failed to transcribe an M4A file ("could not open/decode file") and accepted the WAV version; I could not confirm the format was the cause.

The installer is one script covering the Python environment, PyTorch, OmniVoice and a small web page that runs only on your computer. Claude checks its syntax but cannot test it on your machine, so expect to report errors back. Not verified: how Claude handles your specific video format, and the upload size limit.

Attach your recording and paste the prompt in one message

3

Run the installer. Download the script, open Terminal (see the note below), paste the one line Claude gives you and press Enter. It takes several minutes. Then open the launcher it created; the first generation downloads the model and takes longer.

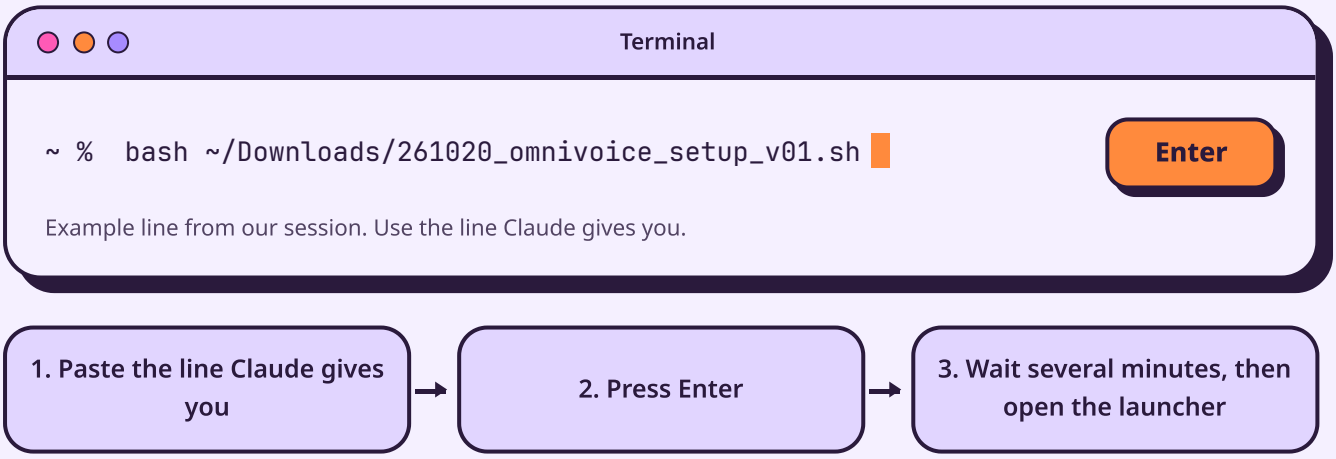

HOW TO

Note on step 3: how to open Terminal.

- **Mac:** click the Launchpad icon in the Dock, type Terminal in the search field and click Terminal. Or open the /Applications/Utilities folder and double-click Terminal (Apple). Pressing Cmd+Space and typing Terminal also works, but that way is not on Apple's page.
- **Windows:** press Win+S, type Windows Terminal and click Open. Or press Win+X and click Terminal (source). If the Win+X menu shows Windows PowerShell instead of Terminal, open that.

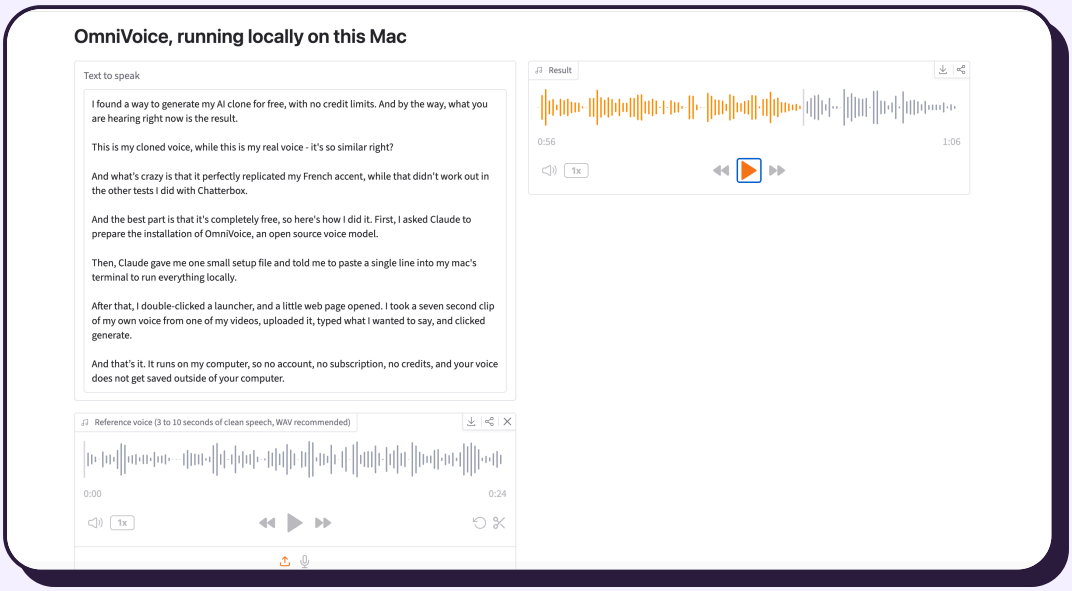

Paste the line Claude gives you into the window and press Enter. Mac commands do not work on Windows; the prompt makes Claude give you the version for your computer, and I have not tested the Windows one.

Paste one line into Terminal and press Enter

▲ step 3 · paste the line in Terminal, press Enter, wait

4 **Clone and generate.** In the web page, upload the WAV clip Claude gave you, type the text you want spoken and click Generate. Typing the exact words of your clip as reference text is optional: per the README, OmniVoice transcribes the clip itself when you leave it empty.

▲ The web page that opens after you start the launcher (screenshot from our test).

5 **Check the result, especially the accent.** Listen next to your real voice. In our test, Chatterbox through Voicebox gave a British accent, while OmniVoice kept a French accent in English, per the person who ran the test. A comparison article also rated OmniVoice best at keeping an accent, but it tested one speaker and is published by a company that sells these models. If the accent is wrong, try a different clip or ask Claude to try another engine.

! Only clone your own voice, or the voice of someone who has said yes (my advice). Not verified: the setup on Windows and Linux, and how long each step takes on your computer.

PROMPT TO REDO IT

Paste this into a new Claude conversation and attach your voice recording or video to the same message. It asks about your computer first and avoids the dead ends from our test (Chatterbox's accent result and M4A files).

```
I want to run a free, local voice clone of my own voice on my computer, with no credit limits and no cloud service. I have no experience with this, so take care of as much of the setup as you can.

I am attaching a video or audio recording of me speaking. If I forgot to attach it, ask me for it before anything else.

Before you do anything else, ask me these questions and wait for my answers:
1. Which computer do I have (Mac, Windows or Linux) and which chip or processor? On a Mac: Apple menu, About This Mac.
2. How much memory (RAM) does it have, and does it have an NVIDIA graphics card?
3. Which language is spoken in my recording, and which language should the cloned voice speak?
4. If my recording is longer than 10 seconds, which part should you use (give me timestamps)? If I do not know, pick a clean stretch of only my voice and tell me what you chose.

Then:
1. Check the format of my file. If it is already a WAV file, keep it as it is and move on to step 2 (only cut it down to a clean 3 to 10 second clip of my voice if it is longer, and make sure it is mono and 16-bit). If it is another audio format (for example M4A or MP3) or a video (for example MP4 or MOV), extract the audio and convert it to a mono, 16-bit WAV file of a clean 3 to 10 second clip of only my voice. Either way, send me the WAV file you will use.
2. Use OmniVoice (github.com/k2-fsa/OmniVoice). Read its current README first and follow the instructions for my computer type. If my setup is not covered there, tell me.
3. Write me ONE installer script that sets up everything: Python environment, PyTorch, OmniVoice, and a small local web page with an upload box for my WAV clip, an optional reference text box, a text box and a Generate button. The page must run on my computer only, with no public share link, and must save each result as a new file so nothing is overwritten. Also write a launcher I can double-click. Name the files in the format YYMMDD_name_v01.
4. Check the script's syntax before giving it to me, and tell me clearly what you could not test on my computer type.
5. Give me the exact steps to run it, in order, with no jargon and with what I should see at each step.
6. After my first test, help me check whether my accent was kept and what to try if it was not.

Rules: link and quote your sources, do not guess, say when you do not know, and label any inference as your own.
