ANIMATE YOUR VIDEOS WITH CLAUDE AND REMOTION

For free, other than a Claude subscription

How I add animations, effects and word-by-word captions to my short videos just by asking Claude. No video editing app, no paid tools on top of my Claude plan.

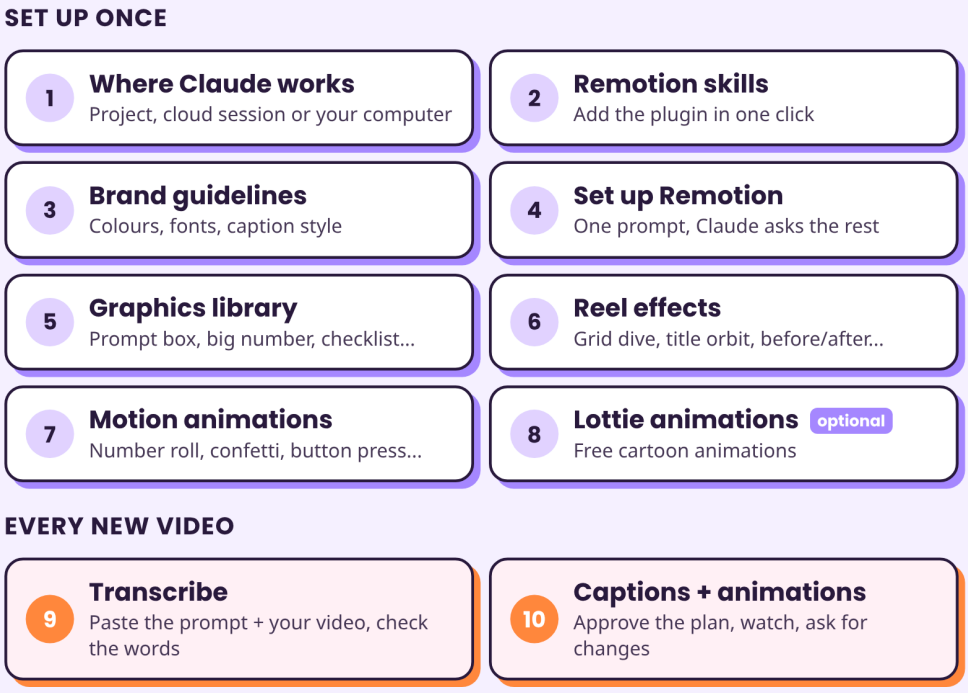

You need: a paid Claude plan (Pro or Max) and the Claude desktop app (or claude.ai/code in a browser), or Claude Code on your own computer (Option C in Step 1). A GitHub account is only needed in some cases (see Step 1).

Three ways to follow this guide: Option A is a Claude project (what I use), Option B is a normal cloud session, Option C is Claude Code on your own computer. Every step has the same prompts for all three. Where Option C is different, a purple box tells you what to do.

How to read this guide: each step starts with **What to do** (the actions and the prompts to copy), then **How it works** (the details, if you are curious).

The 10 steps at a glance

PICTURE **Steps 1 to 8 are done once, steps 9 and 10 for every video**

↻ **Repeat for each video. Built pieces are reused, nothing is built twice.**

10 **Make the captions and place the animations**

Licences and costs

What you get

- You film yourself talking (vertical video, on your phone).
- Claude writes down every word you say, with the exact moment each word is said.
- Claude adds **captions** that appear word by word at the bottom, plus a few **big "pop" words** in another colour that never cover your face.
- Claude adds **animations** at the right moments: a prompt typing into a box, a big number, a checklist, a 3D effect, a cartoon, and so on.
- You watch it, ask for changes in normal words ("move the number to 0:14"), and get a finished MP4.

You never touch a video editing app. You talk to Claude, Claude changes one text file, and a free tool called Remotion turns that file into your video.

What it costs

Item	Cost in my setup	Note
Claude	My existing paid plan	No extra charge for the cloud computer Claude uses, but it counts toward your plan's usage limits. Option C (Claude Code on your computer) also needs a Claude plan.
Remotion (makes the video)	Free for me	Free for individuals and small companies (up to 3 employees). Bigger companies pay.
Speech-to-text (Parakeet + Whisper)	Free	Free models. No account or key needed.
Lottie animations	Free	Free animations from LottieFiles.
Fonts	Free ones work	Google Fonts are free to use in videos.

Details and sources for each are in Licences and costs.

Words you will see

- **Remotion:** a tool that makes videos from code. Instead of dragging clips on a timeline, Claude describes the video in code and Remotion draws it, frame by frame, into an MP4.
- **Render:** turning the project into the finished video file.
- **Claude Code:** Claude working with files and programs, in an app or in a terminal.
- **Cloud session:** Claude working on its own small computer online. It can install tools, run them and send you files. Nothing is installed on your computer.
- **Skill:** a pack of instructions that teaches Claude how to do one kind of task well.
- **timeline.json:** one text file that lists everything in your video (your clip, each caption word, each animation) with its start time and length in seconds. To edit the video, Claude only changes this file.
- **Graphic type:** one reusable animation (for example "big number"). Built once, then reused in any video by adding one line to the timeline.
- **Transcription:** turning speech into text. **Word timings** = when each word starts and ends.
- **Model:** the "brain" file of an AI tool, here the speech-to-text ones.
- **Cut-out:** a copy of your video with the background removed, so things can pass *behind* your head.
- **Safe zones:** the parts of the screen that TikTok or Instagram cover with buttons and text. Animations must stay out of them.

10 **Make the captions and place the animations**

Licences and costs

Step 1: Choose where Claude works

WHAT TO DO

Option A (what I use): a Claude project. No GitHub needed.

1. **Open Projects:** in the Claude desktop app, go to Code, then Projects (if you don't see it, look under More).
2. **Create a new project.** Only the name is required.
3. **Paste this prompt** in the project chat:

PROMPT

```
I want to animate my short videos (TikTok, Instagram Reels) with
Remotion: word-by-word captions, graphics and effects. Start one thread
for the whole setup and keep all the files in this project. In that
thread, I will paste the prompts of the next steps one by one.
```

4. **Open the thread Claude starts**, and paste the prompts of Steps 2 to 8 there, one at a time.
5. **For each new video later**, ask in the project chat: "Start a thread to edit this video" and attach your video.

Option B: a normal cloud session. GitHub needed.

1. **Open Code** in the Claude desktop app.
2. **Pick Cloud:** under the message box, open the environment selector and pick Cloud (not Local).
3. **Pick a GitHub repository.** If you don't have one, create an empty repository with a README on github.com first.
4. **Paste the prompts** of the next steps directly in this session, one at a time.

Option C: Claude Code on your own computer. No project, no GitHub.

1. **Install Claude Code.** On a Mac or Linux, open the Terminal and paste `curl -fsSL https://claude.ai/install.sh | bash`. On Windows, open PowerShell and paste `irm https://claude.ai/install.ps1 | iex`. Never used a terminal? The terminal guide shows how. (Or use the Claude desktop app, go to **Code**, and pick **Local** instead of Cloud.)
2. **Make a folder for your videos**, open the terminal in that folder and type `claude`. Log in with your Claude plan when it asks.
3. **Paste this prompt:**

PROMPT

```
I want to animate my short videos (TikTok, Instagram Reels) with
Remotion: word-by-word captions, graphics and effects. Work in this
folder and keep all the files here. First check my computer for what
Remotion needs (Node.js, FFmpeg and a browser), tell me what is missing,
and install it once I say OK. I will paste the prompts of the next steps
one by one.
```

4. **Say OK** when Claude asks to install something or run a command.
5. **For each new video later**, copy the video file into the folder and tell Claude its name.

Click a step or a part to jump to its page.

10 **Make the captions and place the animations**
Licences and costs

HOW IT WORKS

- A cloud session means Claude works on its own computer online: it can install tools, run them, and send you the finished video. Nothing is installed on your computer.
- In a project, Claude starts a cloud session (a "thread") for each task by itself, and your files stay in the project's **Library** between sessions. Claude's docs say projects work with "the files, folders, and Google Drive folders you upload to the project", and GitHub is only needed "if the project will work on code" that lives in a GitHub repository. Note: "Projects are in public beta on Pro and Max plans and rolling out gradually", so you may not have it yet (projects docs).
- In the desktop app, a normal session does not pick Cloud for you: "Before you send your first message, choose the environment, project folder, permission mode, and model in the row under the prompt box." (desktop docs)
- A normal cloud session needs GitHub: "Cloud sessions require a connected GitHub account" and "You'll need a GitHub repository to get started" (cloud quickstart). Your editor is saved in the repository, so nothing is lost when the cloud computer is wiped.

> **Option C, how it works:** Claude works on your own computer instead of an online one. Claude's docs list what you need: "A Claude subscription (Pro, Max, Team, or Enterprise)" or another supported account (quickstart). The docs also say "Claude Code reads your project files as needed". Your files stay in your folder, so nothing is wiped when a session ends. Claude asks before it runs commands, depending on the permission mode you choose (permission modes). **My inference, not tested in this project:** the computer needs enough free space and speed for the video tools, and Claude has to install them first. I did not check Remotion's official list of requirements, so the first prompt asks Claude to find out for you.

Click a step or a part to jump to its page.

8 Add free Lottie animations optional
9 Transcribe your video
10 Make the captions and place the animations
Licences and costs

Step 2: Add the Remotion skills

WHAT TO DO

Option 1 (fastest): add the Remotion plugin, in one click. Search "Remotion" in Claude's plugin directory and add the plugin called **Remotion**, by Remotion.

Option 2: ask Claude to download the Remotion agent skills. Paste:

PROMPT

```
Download the official Remotion agent skills from github.com/remotion-dev/skills, save them with my project files so they are kept for the next sessions, and follow them whenever you work on my videos.
```

> **With Option C:** nothing changes for Option 2: Claude saves the skills in your folder. Option 1 (the plugin) should work the same way in Claude Code, but I have not tested that.

HOW IT WORKS

Remotion publishes free "skills": instruction packs that teach Claude how to write good Remotion code (remotion-dev/skills). The plugin in the Anthropic plugin directory is described as "Remotion video creation skills" and contains the same 12 skills (remotion-best-practices, remotion-captions, remotion-create, and so on).

Click a step or a part to jump to its page.

8 Add free Lottie animations optional
9 Transcribe your video
10 Make the captions and place the animations
Licences and costs

Step 3: Create your brand guidelines

WHAT TO DO

If you already have brand guidelines (colours, fonts, a style guide, a Canva brand kit), attach them and paste:

PROMPT

```
Here are my brand guidelines. Turn them into one brand file for my
videos: colours with hex codes, fonts (with a free Google Fonts match
for any font I don't have the file for), caption style, animation style
and rules. Ask me about anything that is missing.
```

If you don't have any yet, paste this prompt and answer Claude's questions:

PROMPT

```
Help me create simple brand guidelines for my short videos (TikTok,
Instagram Reels). I am not a designer, so guide me: ask me one question
at a time and suggest answers I can pick from.

Ask me about:
- my channel: what it is about, who it is for, and 3 words for how it
should feel,
- creators or videos whose look I like (ask me for screenshots),
- colours I like or want to avoid.

Then:
1. Propose 3 colour palettes (5 to 6 colours each, with hex codes and
what each colour is for: background, text, accent, pop words). Show them
as one image so I can compare. Check that text stays readable on the
backgrounds.
2. Propose 3 font pairs (titles + captions + an optional handwritten
font), using free Google Fonts only. Show each pair on a sample frame of
a vertical video.
3. Propose a caption style: font, size, colour, where on screen, and how
pop words look (bigger, accent colour).
4. Propose an animation feel (for example playful and bouncy, or calm
and clean).
5. When I have picked, write everything into one brand file (colours,
fonts with their licence, caption style, animation feel, and do / don't
rules), and make one picture of a sample frame using it. Keep it simple
and explain any design word you use.
```

Keep this brand file: the setup prompt in the next step asks for it.

> **With Option C:** copy your brand files into your folder and tell Claude their names. Claude saves the brand file in your folder.

HOW IT WORKS

Do this before setting up Remotion: every graphic, caption and effect will use these colours, fonts and rules, so your videos look like yours from the first render. Claude asks one question at a time, shows you options as pictures, and only writes the brand file once you have picked.

Licences and costs

Step 4: Set up Remotion with one prompt

WHAT TO DO

1. **Paste this prompt as it is.** You don't need to change anything: Claude asks you for what it needs (your brand file, a short test video, where to save the editor).

PROMPT

```
Set up a Remotion video editor for my vertical short videos (TikTok,
Instagram Reels).

Before you start, ask me (one question at a time) for anything you need,
for example:
- my brand file (colours, fonts, caption style). If I don't have one,
stop and help me make one first,
- a short test video of me talking (5 to 10 seconds),
- whether we are in a Claude project or a normal cloud session with a
GitHub repository (so you know where to save the editor).

1. Skills: use the Remotion skills. If they are not loaded, download
them from github.com/remotion-dev/skills and follow them.
2. Project: a Remotion project, 1080x1920, 30 fps. Save it where it will
not be lost when the session ends: in the project's files (Claude
project) or in my GitHub repository (normal cloud session).
3. One timeline file: make timeline.json the single source of truth.
Tracks for video, graphics, captions and audio. Each item has an id, a
type, a start and a duration in seconds, and its own settings. Check the
file with a schema so a mistake stops the render with a clear message.
Every new video = a new timeline file.
4. Brand: copy my brand file into the project (colours, fonts, caption
style, rules). Use the font files with their licence files. Every time I
give feedback on a look ("no rotation", "bigger text"), save it as a
rule in this file.
5. Layout rules (frame 1080x1920, pixels counted from each edge). Save
them in the brand file and follow them in every video:
   - Keep-out zones (covered by the app's buttons, name and caption):
     - TikTok: top 160, bottom 480, left 120, right 120, and right 300
from 840 px down (the like / comment / share buttons).
     - Instagram Reels: top 250, bottom 385, left 70, right 55, and
right 193 from 860 px down.
     - If I post on both, use the stricter number of each side. Never
put text, logos or important parts of a graphic in these zones.
   - My face: never cover my face (eyes, mouth) with text or graphics.
Find my face in the video and place things around it: above my head
first, then beside me, then under my chin.
   - Captions: one word at a time, appearing when I say it. Bold, about
64 px, in my caption colour, centred, at ONE fixed height for the whole
video: below my chin, with its bottom edge no lower than about 1440 px
(above TikTok's bottom zone), and never under the buttons on the right.
   - Pop words: max one per caption line, big (100 to 200 px), in my
accent colour, placed above my head if there is room (between the top
zone and 20 px above my head), otherwise under my chin. Never on top of
the bottom caption.
   - Text size: titles at least 84 px, any other text at least 44 px, so
it is readable on a phone. Text always straight (no rotation) and
readable on its background.
   - Busy screens: max 2 graphics at the same time, and the bottom
caption always stays visible.
   These numbers are estimates from online sources, so render one still
```

Click a step or a part to jump to its page.

The 10 steps at a glance

Licences and costs

```
with the
   zones drawn on it that I can compare with a screenshot from my phone,
and adjust
   them if I ask.
6. My footage: never filter, grade or recolour my original video.
Effects may move, crop, frame or cover it, nothing else. If a clip is an
iPhone HDR video (it would look orange in the render), only relabel its
colour information to standard (bt709) without changing the pixels.
7. What comes next (don't build these now): after the setup, we will do
these steps one at a time. When I start each one, ask me these questions
first:
   - Graphics library: what I usually talk about and show in my videos,
so you can suggest which graphics I need beyond the must-haves.
   - Reel effects: which effects I like (I may send screenshots), and
whether I am OK with you making a cut-out of me (my video with the
background removed).
   - Motion animations: which ones I want and where I would use them.
   - Lottie animations: the animation files I downloaded and where they
should go.
   - Transcription: my video, the language I speak, and the correct
spelling of names or brands I mention.
   - Captions and animations: which pop words I want, and my OK on the
list of animations and their times before you build anything.
8. Rendering: add a preview command and a render command. If the render
fails because Remotion cannot download its browser, use the Chrome
already installed on the cloud computer.
9. Checking: with every render, also make 4 to 6 stills. Look at them
yourself and check them against my brand rules and the safe zones before
sending me anything.
10. Test: render a 5-second test video with my test clip and one word on
screen in my brand style, and send me the video and the stills.
```

2. **Answer Claude's questions.**
3. **Check the 5-second test video** and the still with the safe zones drawn on it. Compare it with a screenshot from your phone and ask for changes if needed.

> **With Option C:** the setup prompt is the same, with these differences:

4. When Claude asks where to save the editor, answer: **"Claude Code on my computer, save it in this folder."** (Item 2 of the prompt.)
5. Instead of attaching the test video, **copy it into your folder** and tell Claude its name.
6. Claude installs what is missing on your computer: **Node.js** (runs Remotion), **FFmpeg** (handles audio and video) and, for Steps 6 and 9, some **Python** tools (the cut-out, face tracking and transcription). Approve each install.
7. Item 8 of the prompt (the cloud Chrome fix) is usually not needed. If the render fails because of the browser, tell Claude to use the Chrome installed on your computer.

HOW IT WORKS

One timeline file. Every new video is just a new timeline, and every animation you build once can be reused forever. Claude writes the timeline for you, you never have to. One line of it looks like this:

Click a step or a part to jump to its page.

Licences and costs

EXAMPLE

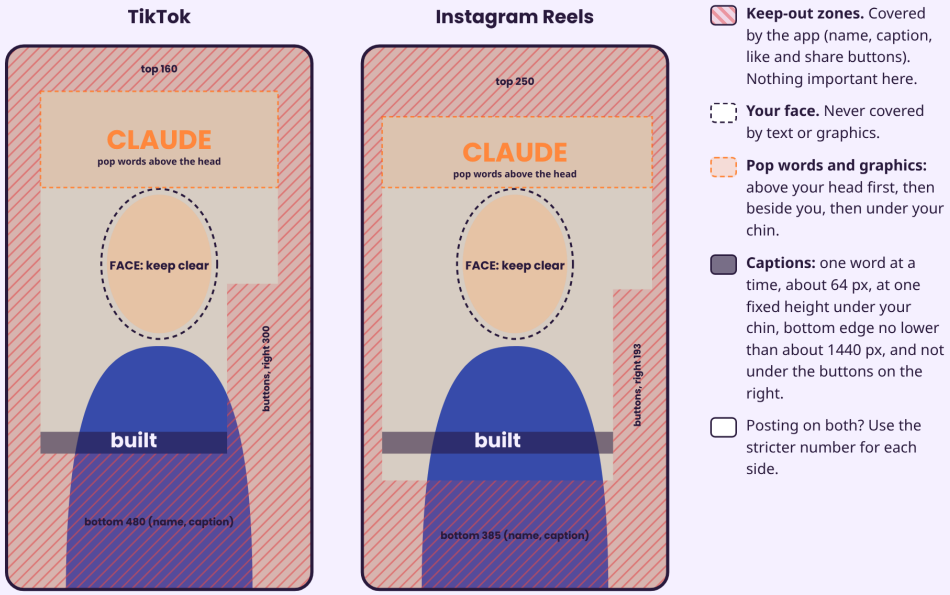

```
{ "id": "prompt-1", "type": "promptBox", "start": 0.3, "duration": 6.4,
  "props": { "prompt": "Make me a travel planner with a map and a
budget.", "highlight": "travel planner" } }
```

PICTURE **timeline.json shown as tracks over 10 seconds**

The layout rules. The numbers in the prompt are the ones I use. They are estimates from online sources and a screenshot of my own phone, not official numbers.

PICTURE **Where things go on the screen on TikTok and Instagram**

The fixes in the prompt come from my own tests: iPhone HDR videos looked orange until the colour information was relabelled, and Remotion sometimes could not download its browser in the cloud. Before filming, you can also turn off **HDR Video** in the iPhone camera settings, so no relabelling is needed.

Click a step or a part to jump to its page.

Licences and costs

Step 5: Build your graphics library

WHAT TO DO

1. **Paste the must-have prompt below.** It builds a first set that covers most talking videos (my choice of the most useful ones).

PROMPT

```
Build the must-have graphics for my video editor, in my brand style,
each as a reusable graphic type I can place in timeline.json:
1. promptBox: a prompt types into a box, one phrase gets a marker
highlight, the send button is pressed, a short handwritten note appears.
2. bigWord: one word, very big, bounces in and out.
3. bigNumber: a big number counts up to its value, a label appears
underneath.
4. kineticLine: a key sentence builds on screen word by word.
5. callout: a handwritten note with a hand-drawn arrow or circle
pointing at a spot.
6. checklist: a card with a title and items that get ticked one by one.
7. exeWindow: an app window opens and shows a screenshot of a result.
8. transition: a quick coloured swipe across the screen between two
parts. Before you start, ask me what I usually talk about and show, and
suggest up to 3 extra graphics from my topics. Then render a preview
video and stills of each graphic, check the stills against my brand
rules and the safe zones, and send them.
```

2. **Answer Claude's question about your topics**, then check the preview video and stills.
3. **Give feedback in plain words** ("no rotation", "bigger text"). Claude saves each rule in your brand file, so the next graphics follow it.
4. **Whenever you want more, paste a prompt from the full list below**, one (or a few) at a time. Replace the example text with yours.

> **With Option C:** nothing changes except that videos and pictures are made on your computer and saved in your folder. If you send screenshots as examples, copy them into the folder.

HOW IT WORKS

Each graphic is built **once** as a reusable "graphic type", then placed in any video by adding one line to the timeline. Graphics that pass behind you (sticker outline, floating cards) use the cut-out of you, which is set up in Step 6. After that, for each new video, ask:

PROMPT

```
Make a cut-out of me from this clip (my video with the background
removed) with Robust Video Matting running on CPU, and save it as a
transparent video for the graphics and effects.
```

It took about 1.5 minutes for an 8-second clip.

The pictures below show some of my graphics on stand-in footage.

Screens and objects

Graphic	What it looks like	Prompt
Phone messages	Chat bubbles pop in on a phone, with typing dots	"Create a graphic type `phoneMessages` : a generic phone (not a copy of any brand's design) with a contact name at the top; chat bubbles pop in one by one, with typing dots before each reply. Settings: contact, messages (who, text, time)."
Toggles	Settings-style switches flip on one after another	"Create a graphic type `toggles` : a card of settings-style switches that flip on one after another. Settings: labels, which ones turn on."
Calendar	A month grid, days get ticked or events pop in	"Create a graphic type `calendar` : a month grid; chosen days get ticked or small events pop in. Settings: month, ticked days, events."
App window	A screenshot of what the AI made, inside a window	"Create a graphic type `exeWindow` : an app window with a title bar that opens and shows a screenshot of a result. Settings: title, image."
File card	A notes file card with lines typing in	"Create a graphic type `fileCard` : a notes card with a file name (like notes.md) and lines that type in. Settings: file name, lines."
Tool pills	Pills with the names of the tools used, plus a name tag	"Create a graphic type `toolPills` : rounded pills with tool names pop in, plus an optional 'hello my name is' tag. Settings: tools, name."
Checklist	Items get ticked one by one	"Create a graphic type `checklist` : a card with a title and items that get ticked one by one. Settings: title, items."
Flowchart	Boxes and arrows draw in	"Create a graphic type `flowchart` : steps in boxes, connected by arrows that draw in one after another. Settings: steps."
Map route	A dashed line travels between pins	"Create a graphic type `mapRoute` : a simple drawn map; a dashed line travels between pins, place names appear. Settings: places."
Clock	A clock hand sweeps a coloured wedge, with a handwritten time label	"Create a graphic type `clock` : a clock whose hand sweeps and fills a coloured wedge, with a handwritten time label. Settings: from, to, label."
Taped photo	A photo or clip drops in, held by tape	"Create a graphic type `tapedPhoto` : a photo or short clip drops in at a small angle and gets taped on. Settings: image or video, caption."
Paper note	Torn lined paper, handwriting writes on	"Create a graphic type `paperNote` : a piece of torn lined paper slides in and handwriting writes on it line by line. Settings: lines."
Thought bubble	A paper cut-out thought bubble with stickers	"Create a graphic type `thoughtBubble` : a paper cut-out thought bubble pops in with small stickers (tag, star, burst) and a short text. Settings: text, stickers."
Folder	A folder opens, documents slide in, its name types	"Create a graphic type `folderFiles` : a folder appears, its name types in, and document cards slide into it. Settings: folder name, files."

Step 6: Add reel effects

WHAT TO DO

1. **Paste the must-have prompt below.** It sets up what the effects need and builds a first set (my choice: a mix of hook, emphasis and "behind me" effects).

PROMPT

```
Set up reel effects for my video editor:
1. Create a graphic type `reelEffect` with a setting `effect` that picks the effect. Use my clip and my brand colours. Never recolour my footage.
2. Cut-out: make a copy of my clip with the background removed (Robust Video Matting on CPU), saved as a transparent video, so things can pass behind me.
3. Face tracking: find my face every 0.1 s (OpenCV), for effects that follow my face.
4. Build these must-have effects:
   - gridDive: a wall of small tiles; the camera dives into the middle tile, which becomes my live video (a hook for the first second).
   - digitalZoom: quick punch-in zooms on my face to stress a word (crop only).
   - screenInScreen: the camera pulls back and my video plays on a drawn laptop.
   - pullBackReveal: the camera pulls back to show my video inside a made-up video editor window with a timeline.
   - titleOrbit: a ring with my title circles my head; the back half passes behind it.
   - depthUI: app windows (a chat with a prompt, a code window, a progress bar) float around me, some behind my head.
   - beforeAfter: a line wipes across; one half "Before", the other half a clean stage "After", me in front.
   - shatter: the picture cracks and breaks into pieces that fly away, showing the next shot. Before you start, ask me which effects I like (I may send screenshots) and whether I am OK with you making a cut-out of me. Then render one demo video of all the effects with my clip, plus stills, and tell me which ones are only partly done.
```

2. **Say which effects you like** and whether you are OK with a cut-out of you, then check the demo video.
3. **Whenever you want more, paste a prompt from the full list below.**

> **With Option C:** the cut-out and the face tracking need Python tools on your computer (Claude installs them, with your OK). In the cloud the cut-out took about 1.5 minutes for an 8-second clip. On your own computer the time depends on your machine, which I have not measured. If you send screenshots of effects you like, copy them into the folder.

HOW IT WORKS

These are bigger, full-screen effects that change how your video itself looks: the camera moves, zooms or turns, the shot breaks, or things pass behind you. Some need a **cut-out** of you (your video with the background removed) so things can pass behind your head, and some follow your face with **face tracking**. The names come from public lists posted by **@charliehills** ("20 video effects for Claude") and

@tenfoldmarc ("16 video effects claude can create") on Instagram. I only used the names and screenshots as inspiration: no footage, code or branding of theirs. Claude built **our own versions**.

Full list of effects

Effects that work with any clip

Effect	What it looks like	Prompt
Grid Dive	A wall of small tiles; the camera dives into the middle tile, which is your live video	"Add reel effect `gridDive` : a wall of small tiles (stills of my clip and coloured cards); the camera dives into the middle tile, which becomes my live video."
Magnifying Lens	A magnifying glass glides in and shows a 2x close-up of what is under it	"Add reel effect `magnifyingLens` : a round lens with a dark handle glides in and shows a 2x close-up of what is under it. Setting: where the lens stops."
Portal	A glowing ring with spinning spirals opens; you are seen through it, then it widens until you fill the screen	"Add reel effect `portal` : a glowing ring opens with spinning spirals, I am seen through it, then the ring widens until I fill the screen."
Infinite Zoom	A small framed copy of your video in a corner; the camera keeps diving into it, endlessly	"Add reel effect `infiniteZoom` : a small white-framed copy of my video sits in the top right; the camera dives into it again and again."
Cube Spin	The shot turns like the side of a cube to show the next shot	"Add reel effect `cubeSpin` : the shot turns in 3D like a cube to show the next clip on its side. Settings: next clip."
Screen in Screen	The camera pulls back and your video plays on a laptop	"Add reel effect `screenInScreen` : the camera pulls back and my video is playing on a drawn laptop."
Tile Tunnel	A 3D corridor of white tiles; the camera flies down it to your video	"Add reel effect `tileTunnel` : a 3D corridor of white tiles with coloured lines; the camera flies down it to my video at the end."
Phone Fan	Your video on a phone, more phones fan out behind it like playing cards	"Add reel effect `phoneFan` : my video plays on a phone; four more phones fan out behind it showing other images (for example my past covers)."
Shatter	Cracks appear, the picture breaks into pieces that fly away, showing the next shot	"Add reel effect `shatter` : white cracks appear, then the picture breaks into about 48 pieces that fly out and fall, showing the next shot behind."
Pull-Back Reveal	The camera pulls back to show your video inside a made-up editing app with a timeline	"Add reel effect `pullBackReveal` : the camera pulls back and my video is inside a made-up video editor window with clips, a sound wave and a moving playhead. Not a real app."
Shutter snapshots	Three snapshots of earlier moments snap on, each with a camera flash	"Add reel effect `shutterStrike` : three instant-photo snapshots of earlier moments snap on at the top, each with a white camera flash."

Effect	What it looks like	Prompt
Digital zoom	Quick punch-in zooms on your face to stress a word	"Add reel effect `digitalZoom` : quick punch-in zooms on my face to stress a word (crop only, no filter)."
Phone mockup	Your video plays in one floating phone	"Add reel effect `phoneMockup` : my video plays inside one phone that floats gently on a coloured stage."
Zoom-Through	The camera rushes into your face with speed lines and comes out in the next shot	"Add reel effect `zoomThrough` : the camera rushes into my face with white speed lines and comes out in the next clip."
Spotlight	The room goes dark and a round light follows your face	"Add reel effect `spotlight` : the room goes dark and a round light opens on my face and follows it." (It darkens your footage around the face.)
Paper cut	The shot tears apart like paper, the next shot is underneath	"Add reel effect `paperCut` : the shot tears apart like paper and the next clip is underneath."

Effects that use the cut-out (something passes behind you)

Effect	What it looks like	Prompt
Title Orbit	A ring with your title circles your head; the back half passes behind it	"Add reel effect `titleOrbit` : a ring with my title in letters circles my head like a halo; the back half passes behind my head. Setting: title (short)."
Clone Room	Six copies of you pop in behind you, smaller and slightly delayed	"Add reel effect `cloneRoom` : six copies of me pop in behind me, smaller and further back, each a quarter of a second late."
Frame Break	A tilted photo frame drops in and your head breaks out over the top	"Add reel effect `frameBreak` : a tilted white instant-photo frame drops in, shakes, and my head breaks out over its top edge."
Depth UI	App windows float around you, some behind your head	"Add reel effect `depthUI` : a chat window with a prompt behind my head, a dark code window, a terminal with a progress bar and a 'Reel ready ✓' pill in front, all drifting gently. Setting: prompt text."
Vertigo	You stay the same size while a grid tunnel behind you rushes toward the camera	"Add reel effect `vertigo` : I stay the same size while a drawn grid tunnel behind me rushes toward the camera (the film 'Vertigo' trick)."
Ribbon Wrap	Two scrolling text ribbons wrap around you, one behind your head, one across your chest	"Add reel effect `ribbonWrap` : two scrolling text ribbons wrap around me, one behind my head and one in front across my chest. Setting: text."
Head Pop Out	Your video in a rounded card; your head rises out of the top of the card	"Add reel effect `headPopOut` : my video in a rounded card on a coloured stage; my head rises out of the top of the card."

Step 7: Add motion animations

WHAT TO DO

1. **Paste the must-have prompt below** (my choice of the most useful ones for "how I did it" videos).

PROMPT

```
Create a graphic type `motionAnim` with a setting `kind`, in my brand colours on light backgrounds, with an option to play it over my video (transparent background). Build these must-have animations:
- numberRoll: digits roll like a slot machine to a value; bars grow underneath.
- buttonPress: a cursor presses a "Publish" button, it fills and turns into "Posted ✓".
- confettiBurst: a check badge pops and confetti bursts out.
- cardsShuffle: a stack of cards; the back card swoops to the front, over and over.
- particlesLogo: a cloud of dots flies together into my logo shape.
Before you start, ask me where I would use them. Then render a demo video and stills.
```

2. **Check the demo video and stills.**
3. **Whenever you want more, paste a prompt from the full list below.**
4. **To see everything you have built**, paste:

PROMPT

```
Render one demo video with every graphic, effect and animation, 3 seconds each, with the name on screen.
```

With Option C: nothing changes.

HOW IT WORKS

Short, polished animations that work on their own or over your video, without changing your video itself. Liquid Glass, Comment bubble and Sticky text came from the effects lists, but they are animated graphics on top of your video, so they are here. The names come from Charlie Hills' carousel "Claude Motion Physics: 16 premium animations you can clone". Ours are our own versions.

Full list of motion animations

Animation	What it looks like	Prompt
Particles to logo	A cloud of dots flies together into a logo shape	"Add motion animation `particlesLogo`: a cloud of dots flies together into my logo shape."
Gradient flow	Soft colour bands flowing like silk	"Add motion animation `gradientFlow`: soft colour bands flowing like silk."

Animation	What it looks like	Prompt
Glass tilt	A frosted glass card tilts in 3D with a light sheen sliding over it	"Add motion animation `glassTilt` : a frosted glass card tilts in 3D with a light sheen sliding over it."
Globe arcs	A dotted globe spins and arcs draw between places	"Add motion animation `globeArcs` : a dotted globe spins and arcs draw between places."
Shape morph	A soft blob keeps changing shape and bounces	"Add motion animation `shapeMorph` : a soft blob keeps changing shape and bounces."
Grid wave	A grid of dots in perspective with a wave rolling through	"Add motion animation `gridWave` : a grid of dots in perspective with a wave rolling through."
Cards shuffle	A stack of cards; the back card swoops to the front, again and again	"Add motion animation `cardsShuffle` : a stack of cards where the back card swoops to the front, over and over."
Number roll	Digits roll like a slot machine to the value; bars grow underneath	"Add motion animation `numberRoll` : digits roll like a slot machine to the value, bars grow underneath. Setting: value."
Ribbon twist	Many thin lines form a ribbon that twists like a DNA strand	"Add motion animation `ribbonTwist` : many thin lines form a ribbon that twists like a DNA strand."
Liquid merge	Two drops drift together and melt into one	"Add motion animation `liquidMerge` : two drops drift together and melt into one (goo effect)."
Phone explode	A phone's layers lift apart, then click back together	"Add motion animation `phoneExplode` : a phone's layers lift apart (exploded view), then click back together."
Orbit	A glowing planet with rings and a small moon going round	"Add motion animation `orbit` : a glowing planet with rings and a small moon going round it."
Button press	A cursor presses a button, it fills and turns into "Posted ✓"	"Add motion animation `buttonPress` : a cursor presses a 'Publish' button, it fills and turns into 'Posted ✓'."
Confetti burst	A check badge pops and confetti bursts out	"Add motion animation `confettiBurst` : a check badge pops and confetti bursts out, with the text 'You're live'."
Comment bubble	A viewer comment card pops in and gets a heart	"Add motion animation `commentBubble` : a viewer-style comment card pops in and gets a heart. Setting: comment text."
Liquid Glass	A frosted glass bar with four icons slides up; a glass bubble hops between icons	"Add motion animation `liquidGlass` : a frosted glass bar slides up with four simple icons; a glass bubble hops from icon to icon and the active icon changes colour." (Ours is a blur, it does not bend the picture like real liquid glass.)
Sticky text	A label sticks next to your head and follows you	"Add motion animation `stickyText` : a coloured label sticks next to my head and follows me as I move (uses face tracking). Setting: text."

10 Make the captions and place the animations
Licences and costs

Step 8 (optional): Add free Lottie animations

WHAT TO DO

1. **Download a free animation** from LottieFiles as **Lottie JSON** (or `.lottie`).
2. **The first time, attach the file** and paste:

PROMPT

```
Add a graphic type `lottie` using @remotion/lottie, with settings: file, position, size, loop, speed. Ask me where this animation should go in my video, then render a test.
```

3. **Every time after, attach the file** and say where it goes, for example:

PROMPT

```
Add this robot animation at 0:02 for 3 seconds, above my head.
```

4. **Keep a small list** of each animation you use (name, creator, link).

> **With Option C:** save the downloaded animation file in your folder and tell Claude its name, instead of attaching it.

HOW IT WORKS

Lottie files are small cartoon-style animations that stay sharp at any size. The LottieFiles licence allows commercial use; credit is optional but encouraged (see Licences).

Click a step or a part to jump to its page.

9 Transcribe your video
10 Make the captions and place the animations
Licences and costs

Step 9: Transcribe your video

WHAT TO DO

1. **Attach your video and paste this prompt:**

PROMPT

```
Here is my video. Transcribe it in the cloud with free models: copy only the audio to a 16 kHz WAV, get word timings from NVIDIA Parakeet TDT 0.6B v2 (int8, via pip sherpa-onnx, model from the k2-fsa/sherpa-onnx GitHub releases), get the words from Whisper large-v3-turbo (also via sherpa-onnx, in pieces of max 25 s cut at pauses). Keep Whisper's words with Parakeet's timings. If a download is blocked by the cloud network settings, tell me which website is blocked and look for the same model on GitHub. Ask me which language I speak and how to spell names or brands I mention. Give me a transcript table (start, end, text) and list every word where the two models disagree.
```

2. **Read the transcript table** and correct any names or wrong words.
3. **Optional: cut pauses and retakes.** If your video still has pauses and retakes, paste:

PROMPT

```
Using the word timings, cut pauses longer than 0.45 s and earlier tries of repeated sentences (keep the last take). Show me the cut list first. Only cut, don't change the picture, and add a tiny sound fade at each cut so there is no click. Then move the word timings to match the cut video.
```

You get a list of the cuts (time, reason, what was said) before anything is cut, and can say "keep cut 3".

> **With Option C:** copy your video into the folder and tell Claude its name. Paste this prompt instead (only the first words change, and the network note):

PROMPT

```
Here is my video (the file name is [name of the file]). Transcribe it on my computer with free models: copy only the audio to a 16 kHz WAV, get word timings from NVIDIA Parakeet TDT 0.6B v2 (int8, via pip sherpa-onnx, model from the k2-fsa/sherpa-onnx GitHub releases), get the words from Whisper large-v3-turbo (also via sherpa-onnx, in pieces of max 25 s cut at pauses). Keep Whisper's words with Parakeet's timings. If a download is blocked by my network, tell me which website is blocked. Ask me which language I speak and how to spell names or brands I mention. Give me a transcript table (start, end, text) and list every word where the two models disagree.
```

HOW IT WORKS

Claude needs every word you say, with the exact time of each word. Two free models run on Claude's cloud computer:

- **NVIDIA Parakeet** gives very precise **timings**, but got a few words wrong on my clips (it heard "don't" instead of "can't", and "This visu" instead of "Bisou bisou").

Licences and costs

- **OpenAI Whisper (large-v3-turbo)** got **every word right** (even with my French accent), but after a pause it showed the next word a bit too early.

So we use **Whisper's words with Parakeet's timings**.

PICTURE **Whisper's words + Parakeet's timings, on "they can't seem to agree"**

What Claude does:

1. Copies **only the sound** of your video into a small audio file. Your video is not changed.
2. Runs **Parakeet** to get the timing of each word (about 8 seconds for an 8-second clip).
3. Runs **Whisper** to get the words. Long videos are cut into pieces of 25 seconds or less, at pauses.
4. **Combines** the two: Whisper's words, placed at Parakeet's times.
5. Gives you the **transcript table** and lists every place where the two models heard something different.

Why GitHub? The cloud computer only reaches websites its network settings allow (cloud environments docs). In my setup, the Hugging Face model files were blocked, but the same models on GitHub worked.

Backup: transcribe on your own computer. Remotion has a tool that runs Whisper on your own computer (`@remotion/install-whisper-cpp` ; its docs say: "With Whisper.cpp, you can transcribe audio locally on your machine."). Ask Claude to prepare it for you. It worked on my MacBook in under a minute for a short clip.

Cutting pauses and retakes: because every word has a time, Claude can find pauses longer than about half a second, earlier tries when you repeat a sentence (it keeps the **last** try), and restarts in the middle of a sentence.

> **Option C, how it works:** the cloud blocked some websites in my setup (that is why the models come from GitHub). On your own computer, the limits are the ones of your own network. I did not test the Parakeet and Whisper combination on a personal computer, only in the cloud. The Whisper-only backup further above is the one I tested on a MacBook.

Step 10: Make the captions and place the animations

WHAT TO DO

1. **Pick the pop words.** Paste:

PROMPT

```
From the transcript, suggest the pop words (max one per line).
```

2. **Agree on the animations before anything is built.** Paste:

PROMPT

```
Read the transcript and propose which graphics, effects and animations
to use and when, for example "0:03 prompt box with ...", "0:12 big
number 5". Tell me where nothing fits. Don't build anything until I
approve.
```

3. **Approve or change the plan**, then paste:

PROMPT

```
Write the timeline: word-by-word captions at the bottom at one fixed
height, pop words big above my head or under my chin (never over my
face, use face tracking), and the approved animations. Start each word
exactly when my voice starts. Follow my layout rules. Render the video
and 6 stills, check them, then send me the video.
```

4. **Watch the video and ask for changes** in plain words, for example "Move the big number to 0:14" or "Make the window bigger and put it above my head".

> **With Option C:** nothing changes. The finished MP4 is saved in your folder. To watch your changes before the final video is made, ask Claude to open a preview of the video (Remotion has a preview window for this).

HOW IT WORKS

Claude turns each change into an edit of `timeline.json` and renders a new version. Keep every version (v01, v02...) so you can go back. Claude checks the stills itself against your brand and layout rules before sending the video, so many problems are caught before you watch.

Click a step or a part to jump to its page.

The 10 steps at a glance
What you get
What it costs
Words you will see
1 Choose where Claude works
2 Add the Remotion skills
3 Create your brand guidelines
4 Set up Remotion with one prompt
5 Build your graphics library
6 Add reel effects
7 Add motion animations
8 Add free Lottie animations optional
9 Transcribe your video
10 Make the captions and place the animations
Licences and costs

Licences and costs

Checked on 2026-10-24. Licences can change, so check the links before using this for a business. This is not legal advice.

What	Cost / licence	Key terms (quoted)	Source
Claude Code on your computer (Option C)	Needs a Claude plan or another supported account	"A Claude subscription (Pro, Max, Team, or Enterprise), Claude Console account, or access through a supported cloud provider". I did not check how local use counts toward your plan's limits.	Quickstart
Claude	Paid plan	Cloud sessions "are available on Pro, Max, and Team plans" and count "toward your plan's usage limits ... there's no separate charge for the cloud VM".	Claude Code docs
Remotion	Free for some, paid for bigger companies	Free if you are "an individual", "a for-profit organization with up to 3 employees", "a non-profit or not-for-profit organization". Otherwise "You are required to obtain a Company License". "In Remotion 5.0, the license will slightly change."	Remotion LICENSE.md
Remotion skills	Not verified	I could not find a licence file in the repository.	remotion-dev/skills
NVIDIA Parakeet TDT 0.6B v2	Free, CC-BY-4.0	"This model is ready for commercial/non-commercial use." "Use of this model is governed by the CC-BY-4.0 license." (CC-BY asks you to credit the creator.)	Model card
OpenAI Whisper	Free, MIT	"Whisper's code and model weights are released under the MIT License."	openai/whisper
sherpa-onnx	Free, Apache 2.0		LICENSE
LottieFiles free animations	Free, Lottie Simple License	Allowed "including for commercial purposes". "Use of Files without attributing the creator(s) of the Files is permitted under this license, though attribution is strongly encouraged." Not allowed: "collect or compile Files from LottieFiles to replicate or develop a similar or competing service."	Lottie Simple License
lottie-web	Free, MIT		LICENSE.md
Robust Video Matting (cut-out)	Free, GPL-3.0		LICENSE
OpenCV (face tracking)	Free, Apache 2.0		LICENSE
FFmpeg (audio, conversions)	Free, LGPL v2.1+	"Most files in FFmpeg are under the GNU Lesser General Public License version 2.1 or later"	LICENSE.md
Fonts	Google Fonts are free (SIL Open Font License)	Check the licence of any other font: some are "personal use only".	Noto Sans OFL

Good to know (limits):

- A full edit uses a good part of your Claude plan's usage. I did not measure how much.
- Transcription was tested in English only, on my own voice. Parakeet v2 is an English model.
- Cutting pauses and retakes was tested on one test video only, so check the cut list carefully.
- Some effects are simpler versions (marked in the tables).
- Option C (Claude Code on your computer) was **not** tested step by step. The Option C notes come from Claude's docs and from my own reasoning, and say so where I am unsure.
- The safe-zone sizes are estimates, not official numbers.
