VOICE_CLONE.exe RUNNING...

Clone Your Own Voice Locally and for Free

a copy of your voice that runs on your computer

What It Does

You get a copy of your own voice that runs on your own computer, with no account, no subscription and no credit limits. You type a text and it speaks it in your voice. The tool is OmniVoice, open source under the Apache-2.0 license (OmniVoice README).

Free: no app or subscription to buy, only your Claude account.

Private: your voice is never sent to a voice company. Everything runs on your computer.

Tested: in our test it kept a French accent when speaking English. Other voices were not tested.

The Whole Thing in 5 Steps

1. Pick a recording of you speaking
2. Paste the prompt and attach the file
3. Run the installer (one line)
4. Type a text and click Generate
5. Check that it sounds like you

How this guide works: read the first part, pick your route, then follow only the steps for that route. The prompt to paste is on the last pages.

HOW TO READ THIS GUIDE

`orange` type or paste exactly this

Bold a button, menu or setting to click

GOOD TO KNOW explains things, no action

What You Need Before You Start

- A Claude account (free, Pro or Max).
- A video or audio recording of you speaking, for example a video you already made. You do not need to convert it yourself.
- A computer (Mac, Windows or Linux). Our test was on a Mac. Windows and Linux were not tested.
- About 30 minutes the first time. Most of it is waiting for the installer.

GOOD TO KNOW

Claude must be able to run code and create files, because it converts your recording and writes an installer file. Anthropic says that on Free, Pro and Max plans "Code execution and file creation" is enabled by default and can be switched in **Settings > Capabilities** (Anthropic).

Choose Your Route

Both routes use the same prompt. Pick the one that fits you.

	Route A: normal Claude chat	Route B: Claude Code
Where	The Claude app or claude.ai	Claude Code in the terminal or the Code tab of the desktop app
Who runs the installer	You, with one line in Terminal	Claude Code can run it for you, after you say yes
Tested	Yes, this is how our test was made	Not tested (my proposal)

GOOD TO KNOW explains things, no action

ROUTE A

The Normal Claude Chat

1 Pick a recording — 2 min

Pick a recording of your voice. Any video or audio of you speaking works. Look for a stretch with no music or other voices, in the language you want the clone to speak.

OPTIONAL

To take the audio out of a video on an iPhone yourself, build a shortcut in the Shortcuts app with **Select Photos** (to pick the video), then **Encode Media** with **Audio Only** turned on, then **Save File** (macmyths). Encode Media can only save M4A or AIF, not WAV (Six Colors), so Claude still converts the file in step 2.

2 Paste the prompt and attach your file — 5 min

1. Open a new Claude conversation.
2. Paste the prompt from the "Prompt to Paste" page at the end of this guide.
3. Attach your recording to the same message and send it.
4. Answer Claude's 4 questions about your computer and your recording.

Claude then gives you two things: your clip as a WAV file and one installer script.

GOOD TO KNOW

Claude asks for your computer type, chip, memory (RAM) and whether you have an NVIDIA graphics card, because the OmniVoice README gives different setups for NVIDIA graphics cards, Apple Silicon and Intel Arc. Claude cuts a 3 to 10 second clip, because the README says longer audio slows things down and may hurt the quality of the copy. In our test, the Voicebox app could not read an M4A file ("could not open/decode file") and accepted the WAV version; I could not confirm the format was the cause.

3 Run the installer — 10 to 20 min

1. Download the installer script Claude made.

2. Open Terminal (see below).
3. Paste the one line Claude gives you and press **Enter**.
4. Wait several minutes. When it is done, open the launcher it created.

TERMINAL

```
~ % bash ~/Downloads/261020_omnivoice_setup_v01.sh
```

press Enter

Example line from our test. Use the line Claude gives you.

TIP

How to open Terminal. **Mac:** click the Launchpad icon in the Dock, type Terminal and click it, or open the Applications > Utilities folder and double-click Terminal (Apple). **Windows:** press Win+S, type Windows Terminal and click **Open**, or press Win+X and click **Terminal** (Eleven Forum). Mac lines do not work on Windows: the prompt makes Claude give you the version for your computer. The Windows version was not tested.

4 Clone and generate

2 min

1. In the little web page that opens, upload the WAV clip Claude gave you.
2. Type the text you want spoken.
3. Click **Generate**.

The first time, the model downloads first, so it takes longer. Typing the exact words of your clip as reference text is optional: per the README, OmniVoice writes them down itself when you leave the box empty.

SCREENSHOT

▲ the web page that opens after you start the launcher (screenshot from our test).

5 Check the accent

2 min

Listen to the result next to your real voice. In our test, Chatterbox (through the Voicebox app) gave a British accent, while OmniVoice kept a French accent in English. A comparison article also rated OmniVoice best at keeping an accent, but it tested one speaker and is published by a company that sells these models (Voice Creator Pro). If the accent is wrong, try a different clip or ask Claude to try another engine.

ROUTE B

Claude Code

My proposal, not tested. Claude Code works in a folder on your computer, so it can convert the file and run the installer itself, after asking you.

1 Put your recording in a folder

2 min

Make a new folder, for example **Voice clone**, and put your recording in it.

2 Open Claude Code in that folder

2 min

In the terminal, go to the folder and start Claude Code. Or open the **Code** tab of the Claude desktop app and pick the folder.

TERMINAL

```
~ % cd ~/Desktop/Voice\ clone
~ % claude
```

press Enter

3 Paste the prompt

15 to 25 min

Paste the prompt from the "Prompt to Paste" page and add this line at the end: **"My recording is in this folder. You may run the installer yourself, but ask me before each command."** Answer the 4 questions, then say yes when Claude Code asks to run something.

GOOD TO KNOW

Claude Code asks before it runs a command on your computer. Read what it wants to run and say yes only if you agree.

4 Generate and check the accent

5 min

Open the launcher Claude Code made, then do steps 4 and 5 of Route A.

Bold a button, menu or setting to click

GOOD TO KNOW explains things, no action

Good to Know

- Only clone your own voice, or the voice of someone who has said yes (my advice).
- Not verified: the setup on Windows and Linux, and how long each step takes on your computer.
- Claude checks the script's syntax but cannot test it on your computer. If something fails, copy the error and paste it back to Claude.
- Each result is saved as a new file, so nothing is overwritten (the prompt asks for this).

Prompt to Paste

Paste this into a new Claude conversation and attach your recording to the same message. It asks about your computer first and avoids the dead ends from our test (Chatterbox's accent result and M4A files). It is also on GitHub as prompt.md.

COPY & PASTE

```
I want to run a free, local voice clone of my own voice on my
computer, with no credit limits and no cloud service. I have no
experience with this, so take care of as much of the setup as you
can.

I am attaching a video or audio recording of me speaking. If I
forgot to attach it, ask me for it before anything else.

Before you do anything else, ask me these questions and wait for my
answers:
1. Which computer do I have (Mac, Windows or Linux) and which chip
or processor? On a Mac: Apple menu, About This Mac.
2. How much memory (RAM) does it have, and does it have an NVIDIA
graphics card?
3. Which language is spoken in my recording, and which language
should the cloned voice speak?
4. If my recording is longer than 10 seconds, which part should you
use (give me timestamps)? If I do not know, pick a clean stretch of
only my voice and tell me what you chose.

Then:
1. Check the format of my file. If it is already a WAV file, keep
it as it is and move on to step 2 (only cut it down to a clean 3 to
10 second clip of my voice if it is longer, and make sure it is
mono and 16-bit). If it is another audio format (for example M4A or
MP3) or a video (for example MP4 or MOV), extract the audio and
convert it to a mono, 16-bit WAV file of a clean 3 to 10 second
clip of only my voice. Either way, send me the WAV file you will
use.
2. Use OmniVoice (github.com/k2-fsa/OmniVoice). Read its current
README first and follow the instructions for my computer type. If
my setup is not covered there, tell me.
3. Write me ONE installer script that sets up everything: Python
environment, PyTorch, OmniVoice, and a small local web page with an
upload box for my WAV clip, an optional reference text box, a text
box and a Generate button. The page must run on my computer only,
with no public share link, and must save each result as a new file
so nothing is overwritten. Also write a launcher I can double-
click. Name the files in the format YYMMDD_name_v01.
4. Check the script's syntax before giving it to me, and tell me
clearly what you could not test on my computer type.
5. Give me the exact steps to run it, in order, with no jargon and
with what I should see at each step.
6. After my first test, help me check whether my accent was kept
and what to try if it was not.

Rules: link and quote your sources, do not guess, say when you do
not know, and label any inference as your own.
```
